

Reddit Data API — Data Access Request

Supporting details submitted with commercial Data Access Request

Applicant

Requesting on behalf of Remedy Skintech, a dermatology clinic group based in BGC, Manila, Philippines (branches: Remedy BGC, Club Remedy BGC, Vertis North, Skin Bar Greenhills). Submitted by the engineering team building the client's internal reputation intelligence platform, referred to internally as "Remedy Pulse."

Role / nature of use

Commercial developer / enterprise partner. This is a paid client engagement, not personal or academic use. Reddit data will be used internally to support a monitoring product built for a single business client; it is not resold, redistributed, or used to train any model.

Use case

Remedy Pulse is a social listening and reputation intelligence tool built to replace an existing paid monitoring subscription. It tracks organic, unpaid conversation about the client's brand and a small set of named competitor dermatology/skincare brands, alongside other channels already in use (news via GNews, and pending review-site and social API integrations). Reddit is the intended source for informal, consumer-to-consumer discussion that doesn't appear in press or business-listing data — the kind of conversation the client's marketing team currently has no visibility into.

What the integration does

Using PRAW (Python Reddit API Wrapper) with OAuth authentication, the tool performs keyword-based searches across public Reddit content for mentions of the client's brand name and its known variants, plus a small, fixed list of named competitor brands. Matched posts and comments are stored with sentiment/topic tagging for internal reporting dashboards. No private, non-public, or authenticated user data is accessed.

Subreddits / scope

Search is keyword-driven rather than restricted to a fixed subreddit list, since relevant conversation can appear in general beauty/skincare communities as well as Philippines- or Manila-focused communities.

Expected request volume

Low volume: this supports one client with four branches and a short list of tracked competitor brands, with periodic (not continuous real-time) polling.

Data handling

The tool complies with Reddit's Responsible Builder Policy: content and author-identifying data are removed within 48 hours of deletion on Reddit, OAuth is used for all requests, and a descriptive, versioned User-Agent string identifies the application per Reddit's required format.
